TITLE: “Axonometric Rectangle”

DESCRIPTION:

This one makes 3D rectangular objects.

Usually when you start drawing most 3D objects, you start out with two connected parallelograms to represent a right rectangular prism. This macro draws it for you so you can copy it into your drawing. The unnecessary lines can be deleted later, but they are handy to keep if you need to draw from one of the points that would be obscured from view if a solid figure is depicted.

I usually delete the lines or slide the endpoints when the drawing is finished.

In a way, it is similar to an extrude function.
